

Title: Problem Statement

Food delivery businesses receive a large amount of customer ordering data every day. However, without proper analysis, it is difficult to understand customer preferences, ordering behavior, revenue trends, and service performance.

The organization needs a visual analytics solution that converts raw data into meaningful insights.

The project aims to develop an interactive Tableau dashboard that allows users to:

- Monitor total orders.
- Analyze total revenue.
- Track average customer ratings.
- Compare meal type preferences.
- Analyze payment methods.
- Understand customer ordering patterns.
- Identify business improvement opportunities.

The solution helps decision-makers improve operational efficiency and customer satisfaction through data visualization.
